Process for the preparation of sheets

Abstract

A device and a process for the preparation of sheets (7, 17) are specified. The following work steps are involved in the preparation of the sheets:

- extruding a film tube (1)
- laying the film tube flat and squeezing it (1)
- reversing the film tube (1)
- cutting the extruded film tube (1)

In addition the invention contains following new characteristics:

- the film tube (1) is cut before the squeezing follows and
- at least one resulting sheet (7, 17) runs through (1) only one reversing device (100) before it is fed to a stationary processing device or storage device.
